ABSTRACT

In a developing country such as ours, air transportation has become a norm for its citizens as this means of transportation is much faster, convenient and more efficient **than all other modes of transportation within the country's shores.**

The importance of an airport in our states and regions cannot be over-emphasized as it provides the most convenient means of transportation from one place to another.

The most important aspect of transportation is safety as popularly said by *Federal Road Safety Commission*, "Safety First".

This project is focused on producing a facility that will ensure safety, eliminate traffic collision between the arrival and departure areas provide facilities that will facilitate the movement of luggage and amongst all, ensure the security of life and property.

This facility will not only stand as a landmark in its location but also be an architectural masterpiece, with the best of material and finishes to depict architecture of its class.

The structure would be such that is expandable with loading bridges for maximum efficiency, and at the same time with a decreased noise level.

Generally, the facility would be designed to maximize the safety and security of passengers and to maintain high aesthetics, customer service and efficiency, alongside forming a dramatic interface between the airport and the business district around its location.
